SaaS Development Internship

Collaborne is a fully funded venture-backed enterprise software startup (SaaS) based in Amsterdam. Collaborne is seeking smart, enthusiastic, and driven interns who want to be part of reinventing how business information is accessed and work is done in thousands of organizations across the world.

Responsibilities
- Build and maintain our high-performance SaaS application (Java stack). Collabonne is an API-centric service with mobile, web, and 3rd party clients.
- Dream-up, innovate, design and implement new features. Interact with users, consultants, and sales people to understand how your technical ideas can wow users.
- Take ownership of your work which will be pushed multiple times per day into production.
- Take risks to push the innovation limits: if things never break, you don’t take enough risk.
- Stay up-to-date with new emerging technologies - especially around data discovery and Big Data.
- Just be yourself!

Requirements
- Bachelor (last year) or Master student in Computer Science or equivalent.
- Experience with Java development in an open source community or in a commercial company is a plus.
- Good written and verbal communication skills in English (no Dutch required).
- Nothing-is-impossible attitude.

What we offer
As a full member of the core product team, you’ll carry significant responsibility from day-1. Just commit the code and you’ll have people using it within minutes. You’ll have the opportunity to focus more on product development and engineering, on product management, or in other areas of the business.

We strive to build an inspiring, intellectually challenging, and fast-moving environment where we celebrate merit. We expect you to challenge the status quo and to let your imagination loose. Imagine and build. Take risks and innovate. Our offices are in a beautiful canal-front building in the inner city of Amsterdam (we see the Amstel hotel from our windows).

At Collabonne, you’ll have the opportunity to work and mingle with serial entrepreneurs, top executives, and technology leaders, including:
- Architect & lead developer of one of the largest SaaS installation on AWS (1,500+ servers) and FreeBSD contributor
- Former COO of NeXT Computer (yes the Steve Jobs company!), Former CEO of Gemplus (the inventors of the smart cards), on the board of Realnetworks, Trion Worlds (games such as Rift, Defiance, End of Nations), on24, DMTG, and more.
- Former CTO and roadmap owner of the world's leading targeting software used by many of the largest eCommerce stores (HP, Toys'r'us, etc)

Company
Collabonne is a labor of love for us. The idea was born from an opportunity common to many organizations: despite having smart, competent, and driven people, we struggled to leverage the full potential of our human capital. Rigid processes, ineffective information flows, and unfriendly systems have led to operational silos that hinder our collective performance. And so Collabonne was started, with a mission to empower every person to become more productive, help teams to achieve greater things, and propel organizations to perform better.

The opportunity to vastly increase team productivity and enterprise performance is universal to many organizations in the world. Collabonne connects people with enterprise applications, information, and processes in an entirely personal and contextual way, bringing together what matters to get work done better and faster.

To apply for this internship, please email your CV to ronny@collabonne.com (Ronny Roeller)
