UTOPIA

Consider a perfect, utopian place that simulates the earth that we live on, with no ecological changes. Economy and every day needs would be supported by consuming green energy, exchanging services and goods. Technology research would be used only for creativity, usability, health and accessibility issues. Technology products would be accessible and free for everyone and anytime. There would be Wi-Fi spots/3G networks everywhere and people could use features and apps whenever needed. Education system would be by far more independent, open-minded and free. Every person could attend studies of any field in real time or online. There would be special games for children's and adults' education. This environment could be expanded, depending on the citizens' needs. It would have an integrated intelligent system for solving conflicts and problems, and also keeping the balance. Prisons would be a place where people could get feedback and gain knowledge in several fields of study. Prisoners should also work and offer services in prisons, so that they could participate in sports/studies/workshops and obtain their every day needs. Every citizen would have a public, digital blog where he/she could upload interests, needs, thoughts, communicate with the others and review his/her feedback. Every society (including prisons) would also have this blog. There would be rewards for citizens and societies, displayed in their blogs. These rewards would be gained by activities, evaluated from the humanitarian side (like helping disabled people, recycling, creating and offering better facilities, etc.). In a place like this, people could enjoy their free time, explore their interests, avoid stressful or bad experiences, understand themselves to achieve their goals and have better communication with each other.
